

Learning Outcomes from the Project

Collin Dorsett

1 WHAT DID YOU LEARN FROM ALL THIS?

Collin Dorsett

What technical information did you learn?

I did enjoy working with Python, as I haven't used it for many other projects, and it was nice to have others share their knowledge of how the language works. Also, using the graphics library Kivy was rather challenging but interesting at the same time.

What non-technical information did you learn?

Documentation is very important, as it helps keep the client and the team on the same page on where the project should be heading.

What have you learned about project work?

Project work can be challenging, especially with many people working on the same pieces of code. Also, making sure that everyone on the team has an idea of how the code works, what needs to be finished, and how the team is going to accomplish that is vital to the project.

What have you learned about project management?

Making sufficient progress on the project and ensuring that deadlines are met proved to be rather challenging. This was mostly due to our team having very busy schedules outside of this course.

What have you learned about working in teams?

Having multiple members working on the same piece of code can be challenging, and I do think I need more experience in that particular area. However, this course was a nice insight on how group dynamics can affect the process of the project.

If you could do it all over, what would you do differently?

Definitely would have done some more research on various Python graphics libraries. One of our largest issues was working with the Kivy library, and use of another library/language, such as JavaScript, might have made the process much easier. Also I definitely should have taken a lighter course load so I could help more with the project overall.
